

# Proximus Smart Network

Your network in the cloud

The marketing director wants a new marketing app in the cloud for all his employees. The payroll processing must continue to run. And that consultant also wants temporary access to connect the new alarm system to the network. You run up against it almost every day: your company network becomes congested through the many applications and the increased Internet traffic. If you're not careful, you end up with a jumble of servers, switches and routers which require extra time and money to maintain. Only by having a good overview, you can keep things under control.

**80%**

of small and medium-sized organizations make a back-up of their data, but not of their network configuration.

**>50%**

of support calls in a company are about «it's going too slowly».

**40%**

of network traffic during working hours is not work-related, but gets the same priority over the network.

## Future evolutions: 2020

95%

of apps will run in the cloud

3x

more mobile devices than humans in the world

Network traffic

## With Proximus Smart Network, managing your network becomes child's play

### Everything under control!

Your entire network configuration is in the cloud. This means you always have a back-up of the latest changes. The result: you no longer need to worry about updates and patches, and any faulty device is replaced quickly.

### Your network mapped out

Resolve problems remotely. Create detailed reports and make adjustments where necessary. All this using the dashboard, accessible from anywhere, anytime.

### Want to give a visitor or external partner access?

Please do! But a virus on his/her PC can bring your entire network to a standstill. Therefore, screen off your internal network with guest VLANs. They're set up in no time.

### Fast Wi-Fi for everyone!

Divide the workload evenly across the different access points, ensuring every employee can work quickly and comfortably.

### Pay only for what you use

Want to connect additional equipment? Or upgrade with the very latest equipment? It's all possible! Without spending even a cent too much. Because with the Proximus Smart Network, you pay only for what you use.

### Bring on the future

In 2020, 95% of applications will run in the cloud and an optical fiber connection will become necessary. But don't worry! Proximus Smart Network is already ready for it.
